USE OF CETP INHIBITORS AND OPTIONALLY HMG COA REDUCTASE INHIBITORS AND/OR
ANTIHYPERTENSIVE AGENTS

10 This invention relates to cholesterol ester transfer protein (CETP) inhibitors,
pharmaceutical compositions containing such inhibitors, and the use of such
inhibitors to treat certain disease/conditions optionally in combination with certain
therapeutic agents e.g., antihypertensive agents.

Background of the Invention

15 Artherosclerosis and its associated coronary artery disease (CAD) is the
leading cause of mortality in the industrialized world. Despite attempts to modify
secondary risk factors (smoking, obesity, lack of exercise) and treatment of
dyslipidemia with dietary modification and drug therapy, coronary heart disease (CHD)
remains the most common cause of death in the U.S., where cardiovascular disease
accounts for 44% of all deaths, with 53% of these associated with atherosclerotic
20 coronary heart disease.

Risk for development of this condition has been shown to be strongly
correlated with certain plasma lipid levels. While elevated LDL-C may be the most
recognized form of dyslipidemia, it is by no means the only significant lipid associated
contributor to CHD. Low HDL-C is also a known risk factor for CHD (Gordon, D.J., et
25 al., "High-density Lipoprotein Cholesterol and Cardiovascular Disease", Circulation,
(1989), 79: 8-15).

High LDL-cholesterol and triglyceride levels are positively correlated, while
high levels of HDL-cholesterol are negatively correlated with the risk for developing
cardiovascular diseases. Thus, dyslipidemia is not a unitary risk profile for CHD but
30 may be comprised of one or more lipid aberrations.

Among the many factors controlling plasma levels of these disease
dependent principles, cholesteryl ester transfer protein (CETP) activity effects all
three. The role of this 70,000 dalton plasma glycoprotein found in a number of
animal species, including humans, is to transfer cholesteryl ester and triglyceride
35 between lipoprotein particles, including high density lipoproteins (HDL), low density
lipoproteins (LDL), very low density lipoproteins (VLDL), and chylomicrons. The net
result of CETP activity is a lowering of HDL cholesterol and an increase in LDL
cholesterol. This effect on lipoprotein profile is believed to be proatherogenic,
especially in subjects whose lipid profile constitutes an increased risk for CHD.

5 Commonly assigned U.S. Patent No. 6,197,786 (the disclosure of which is hereby incorporated by reference) discloses certain CETP inhibitors including [2R,4S]-4-[(3,5-bis-trifluoromethyl-benzyl)-methoxycarbonyl-amino]-2-ethyl-6-trifluoromethyl-3,4-dihydro-2H-quinoline-1-carboxylic acid ethyl ester also known as torcetrapib. In addition, these CETP inhibitors are disclosed as being useful for such
10 indications as atherosclerosis, peripheral vascular disease, dyslipidemia, hyperbetalipoproteinemia, hypoalphalipoproteinemia, hypercholesterolemia, hypertriglyceridemia, familial-hypercholesterolemia, cardiovascular disorders, angina, ischemia, cardiac ischemia, stroke, myocardial infarction, reperfusion injury, angioplastic restenosis, hypertension, vascular complications of diabetes, obesity or
15 endotoxemia.

In addition, the CETP inhibitors are stated to be useful in combination with a second compound, said compound being an HMG-CoA reductase inhibitor, an microsomal triglyceride transfer protein (MTP)/Apo B secretion inhibitor, a PPAR activator, a bile acid reuptake inhibitor, a cholesterol absorption inhibitor, a
20 cholesterol synthesis inhibitor, a fibrate, niacin, an ion-exchange resin, an antioxidant, an ACAT inhibitor or a bile acid sequestrant. Barter, Philip J.; Brewer, H. Bryan; Chapman, M. 30 The conversion of 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) to mevalonate is an early and rate-limiting step in the cholesterol biosynthetic pathway. This step is catalyzed by the enzyme HMG-CoA reductase. Statins inhibit HMG-CoA reductase from catalyzing this conversion. The following paragraphs describe exemplary statins.

Given the positive correlation between lipid modulation and lipid fraction modulation in blood with the development of various disease/conditions such as cardiovascular, cerebral vascular and peripheral vascular diseases, the compounds/combinations of this invention and the salts of such compounds, by virtue
15 of their pharmacologic action, are useful for the prevention, arrestment and/or treatment of disease states/conditions as described above. These include cardiovascular disorders (e.g., angina, cardiac ischemia and myocardial infarction) and complications due to cardiovascular disease. In particular, given the correlation between HDL modulation and the disease/conditions described above the CETP
20 compounds described herein and combinations thereof by virtue of their HDL modulating pharmacologic action (e.g., HDL elevation) are useful for the prevention, arrestment and/or treatment of the disease states/conditions as described above.

The utility of the compounds/combinations of the invention and the salts of such compounds as medical agents in the treatment of the above described
25 disease/conditions in mammals (e.g. humans, male or female) is demonstrated by the activity of the compounds of this invention in conventional assays (e.g., *in vivo* assays, *in vitro* assays) known to those skilled in the art including those described herein. In particular, the PLASMA LIPIDS ASSAY described below may be used to determine the level of HDL modulation for a given compound/combination and thus
30 its therapeutic impact for the disease/conditions described above. Such assays also provide a means whereby the activities of the compounds/combinations of this invention and the salts of such compounds (or the other agents described herein) can be compared to each other and with the activities of other known compounds. The results of these comparisons are useful for determining dosage levels in mammals,
35 including humans, for the treatment of such diseases. For example, the characterization of the impact of of the compounds/combinations of this invention and the salts of such compounds (or the other agents described herein) on various lipid fractions can be determined by methods known in the art as are described in

5 Methods in Enzymology, Vol. 129: Plasma Lipoproteins, Pt. B: Characterization, Cell
Biology, and Metabolism. Albers, John J.; Segrest, Jere P.; Editors. USA.

Plasma Lipoproteins, Pt. A: Preparation, Structure, and Molecular Biology.
Segrest, Jere P.; Albers, John J.; Editors. USA. (1986), 992 pp. (Academic
10 Press, Orlando, Fla.). In particular, the PLASMA LIPIDS ASSAY described below
may be used to determine the level of HDL modulation for a given
compound/combination and thus its therapeutic impact for the disease/conditions
described above.

The following are exemplary assays.

15

CETP IN VITRO ASSAY

The following is a brief description of the assay of cholesteryl ester transfer in
human plasma (*in vitro*) and animal plasma (*ex vivo*): CETP activity in the presence
or absence of drug is assayed by determining the transfer of ^3H -labeled cholesteryl
oleate (CO) from exogenous tracer HDL to the nonHDL lipoprotein fraction in human
20 plasma, or from ^3H -labeled LDL to the HDL fraction in transgenic mouse plasma.
Labeled human lipoprotein substrates are prepared similarly to the method described
by Morton in which the endogenous CETP activity in plasma is employed to transfer
 ^3H -CO from phospholipid liposomes to all the lipoprotein fractions in plasma. ^3H -
labeled LDL and HDL are subsequently isolated by sequential ultracentrifugation at
25 the density cuts of 1.019-1.063 and 1.10-1.21 g/ml, respectively. For the activity
assay, ^3H -labeled lipoprotein is added to plasma at 10-25 nmoles CO/ml and the
samples incubated at 37° C for 2.5-3 hrs. Non-HDL lipoproteins are then precipitated
by the addition of an equal volume of 20% (wt/vol) polyethylene glycol 8000 (Dias).
The samples are centrifuged 750 g x 20 minutes and the radioactivity contained in
30 the HDL containing supernatant determined by liquid scintillation. Introducing varying
quantities of the compounds of this invention as a solution in dimethylsulfoxide to
human plasma, before addition of the radiolabeled cholesteryl oleate, and comparing
the relative amounts of radiolabel transferred allows relative cholesteryl ester transfer
inhibitory activities to be determined.

35

CETP IN VIVO ASSAY

Activity of these compounds *in vivo* can be determined by the amount of
agent required to be administered, relative to control, to inhibit cholesteryl ester
transfer activity by 50% at various time points *ex vivo* or to elevate HDL cholesterol

5 by a given percentage in a CETP-containing animal species. Transgenic mice expressing both human CETP and human apolipoprotein AI (Charles River, Boston, MA) may be used to assess compounds *in vivo*. The compounds to be examined are administered by oral gavage in an emulsion vehicle containing olive oil and sodium taurocholate. Blood is taken from mice retroorbitally before dosing. At various times
10 after dosing, ranging from 4h to 24h, the animals are sacrificed, blood obtained by heart puncture, and lipid parameters measured, including total cholesterol, HDL and LDL cholesterol, and triglycerides. CETP activity is determined by a method similar to that described above except that ³H-cholesteryl oleate containing LDL is used as the donor source as opposed to HDL. The values obtained for lipids and transfer activity
15 are compared to those obtained prior to dosing and/or to those from mice receiving vehicle alone.

PLASMA LIPIDS ASSAY

The activity of these compounds may also be demonstrated by determining the amount of agent required to alter plasma lipid levels, for example HDL cholesterol
20 levels, LDL cholesterol levels, VLDL cholesterol levels or triglycerides, in the plasma of certain mammals, for example marmosets that possess CETP activity and a plasma lipoprotein profile similar to that of humans (Crook et al. Arteriosclerosis 10, 625, 1990). Adult marmosets are assigned to treatment groups so that each group has a similar mean \pm SD for total, HDL, and/or LDL plasma cholesterol
25 concentrations. After group assignment, marmosets are dosed daily with compound as a dietary admix or by intragastric intubation for from one to eight days. Control marmosets receive only the dosing vehicle. Plasma total, LDL, VLDL and HDL cholesterol values can be determined at any point during the study by obtaining blood from an antecubital vein and separating plasma lipoproteins into their individual
30 subclasses by density gradient centrifugation, and by measuring cholesterol concentration as previously described (Crook et al. Arteriosclerosis 10, 625, 1990).

Conventional clinical designs and methods of modifying those clinical protocols to facilitate the testing of the compounds/combinations of this invention and
35 the salts of such compounds (or the other agents described herein) for the various disease/conditions described above are known to those skilled in the art.

For example, in such clinical studies levels of atherosclerotic plaque can be measured by various imaging techniques e.g., Intracardiac ultrasound (ICE),

5 quantitative coronary angiography, intravascular ultrasound (IVUS) including
coronary intravascular ultrasound, carotid intimal medial thickness (CIMT)
measurement, magnetic resonance imaging (MRI), magnetic resonance coronary
angiography, flow-mediated dilatation, positron emission tomography, multislice
10 multi-slice spiral CT (MSCT), echo cardiography, coronary angiography, radiography
and radionuclide imaging.

These imaging techniques and the interpretation of them are known and are
further described in for example, "Measurement of Subclinical
Atherosclerosis: beyond risk factor assessment", Current Opinion in Lipidology 13,
15 595-603 (2002); "A Comparison of Intravascular, Ultrasound With Coronary
Angiography for Evaluation of Transplant Coronary Disease in Pediatric Heart
Transplant Recipients", Journal of Heart & Lung Transplantation 22, 44-49 (2003);
and "Assessment of Calcium Scoring Performance in Cardiac Computed
Tomography", European Radiology 13, 484-97 (2003).

20 The compounds of the present invention are generally administered in the
form of a pharmaceutical composition comprising at least one of the compounds of
this invention together with a pharmaceutically acceptable vehicle, carrier or diluent.
Thus, the compounds of this invention can be administered either individually or
together in any conventional oral, parenteral or transdermal dosage form.

25 For oral administration a pharmaceutical composition can take the form of
solutions, suspensions, tablets, pills, capsules, powders, and the like. Tablets
containing various excipients such as sodium citrate, calcium carbonate and calcium
phosphate are employed along with various disintegrants such as starch and
preferably potato or tapioca starch and certain complex silicates, together with
30 binding agents such as polyvinylpyrrolidone, sucrose, gelatin and acacia.
Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate
and talc are often very useful for tableting purposes. Solid compositions of a similar
type are also employed as fillers in soft and hard-filled gelatin capsules; preferred
materials in this connection also include lactose or milk sugar as well as high
35 molecular weight polyethylene glycols. When aqueous suspensions and/or elixirs are
desired for oral administration, the compounds of this invention can be combined with
various sweetening agents, flavoring agents, coloring agents, emulsifying agents

-142-

5 and/or suspending agents, as well as such diluents as water, ethanol, propylene glycol, glycerin and various like combinations thereof.

The combinations of this invention may also be administered in a controlled release formulation such as a slow release or a fast release formulation. Such controlled release formulations of the combination of this invention may be prepared
10 using methods well known to those skilled in the art. The method of administration will be determined by the attendant physician or other person skilled in the art after an evaluation of the subject's condition and requirements. The generally preferred formulation of amlodipine is Norvasc®.

Many of the CETP inhibitors of this invention are poorly soluble and a dosage
15 form that increases solubility facilitates the administration of such compounds. One such dosage form is a dosage form comprising (1) a solid amorphous dispersion comprising a cholesteryl ester transfer protein (CETP) inhibitor and an acidic concentration-enhancing polymer; and (2) an acid-sensitive HMG-CoA reductase inhibitor. This dosage form is more fully described in U.S. provisional application
20 serial no. 60/435345 filed on December 20, 2002 and entitled "Dosage Forms Comprising a CETP Inhibitor and an HMG-CoA Reductase Inhibitor" the specification of which is hereby incorporated by reference.

The compounds of this invention either alone or in combination with each other or other compounds generally will be administered in a convenient formulation.
25 The following formulation examples only are illustrative and are not intended to limit the scope of the present invention.

Combination tablets of amlodipine besylate, torcetrapib, and atorvastatin hemicalcium were prepared at a scale of ~1kg according to the procedure immediately following the Table. The doses prepared and the composition of the
30 tablets are detailed in the following Table.

A separate granulation or blend of each active component was prepared initially and these three powder mixtures were combined in different proportions to provide the desired dose combinations.

5 The atorvastatin hemicalcium granulation was prepared by making a solution of the hydroxypropyl cellulose and polysorbate 80 in water. The remaining components (except magnesium stearate) were then charged to a fluid bed granulator and wet-granulated with the binder solution by fluidizing them in a warm air stream (30-60C) while spraying the binder solution onto the powders in the
10 granulator. After all the binder solution had been sprayed the granules were dried in the fluidized bed, and milled to remove any large (>1mm) agglomerates. The granules were lubricated by blending them with magnesium stearate.

A dispersion of torcetrapib in the polymer hypromellose (hydroxypropyl methylcellulose) acetate succinate was made by dissolving both components in
15 acetone and spray drying (see U.S. provisional application serial no. 60/435,345) the resulting solution in conventional spray drying equipment. The torcetrapib granulation was made by blending the resulting spray dried dispersion, microcrystalline cellulose, crospovidone, and magnesium stearate together and dry granulating the powder blend by roller compaction. Standard pharmaceutical roller
20 compaction equipment and operating conditions were used. The resulting compacted ribbons were milled to produce granules suitable for further processing. The calcium phosphate and magnesium stearate were added and blended with the granules to create the final lubricated torcetrapib blend.

The amlodipine besylate was simply blended with its excipients to produce a
25 lubricated amlodipine powder blend.

The three active granulations/blends were blended together in the desired proportions using a low-shear twin-shell blender and tableted using a single punch eccentric tablet press.

Administration of the compounds of this invention can be via any method
30 which delivers a compound of this invention systemically and/or locally. These methods include oral routes, parenteral, intraduodenal routes, etc. Generally, the compounds of this invention are administered orally, but parenteral administration (e.g., intravenous, intramuscular, subcutaneous or intramedullary) may be utilized,

for example, where oral administration is inappropriate for the target or where the patient is unable to ingest the drug.

These methods and combinations are useful depending on the indication/condition to treat mammals including humans. In addition, they are useful to advantageously and/or selectively treat a variety of patient subgroups including males, females, the elderly (>60), infants (<2), pediatrics, diabetics (Type I and/or II), patients without a history of coronary events (i.e. primary prevention), patients who have had at least one coronary event (i.e., secondary prevention), patients who have had a cerebrovascular event (e.g., stroke or transient ischemic event), patients with total cholesterol above 250, patients with total cholesterol above 200, patients with total cholesterol below 200, patients with HDL <30/40/50/60, patients with high HDL, different ethnic subpopulations (africans, turkish, hispanics, asians), woman \pm HRT (pre/post menopausal), smokers, patients with low HDL due to diet, patients with secondary reductions in HDL due to other medications (e.g., androgen agonists), patients with peripheral vascular disease, patients with normal HDL-C e.g., between 40 and 60 mg/dec, stroke patients without a history of coronary heart disease (with or without abnormal cholesterol levels), patients with metabolic syndrome, patients with the apo-E4 allele, patients with BMI greater than 30, and obese patients.

In general an amount of a compound(s)/combination(s) of this invention is used that is sufficient to achieve the therapeutic effect desired (e.g., HDL elevation). The amount will, of course, be dependent on the subject being treated, on the severity of the affliction, on the manner of administration and on the judgement of the prescribing physician.

In general an effective dosage for the CETP inhibitors of this invention, their prodrugs and the salts of such compounds and prodrugs is in the range of about 0.01 to about 100 mg/kg/day, preferably about 0.1 to about 5 mg/kg/day.

An especially preferred dosage of [2R,4S]-4-[(3,5-bis-trifluoromethyl-benzyl)-methoxycarbonyl-amino]-2-ethyl-6-trifluoromethyl-3,4-dihydro-2H-quinoline-1-carboxylic acid ethyl ester (torcetrapib) is about 15mg per day to about 240 mg per day, preferably about 30 mg per day to about 120 mg per day. The dosage may be administered in single or multiple dosages (e.g., bid).

A dosage of the combination pharmaceutical agents (e.g., antihypertensive agents, statins) to be used in conjunction with the CETP inhibitors is used that is effective for the indication being treated.

For example, typically an effective dosage for HMG-CoA reductase inhibitors is in the range of about 0.01 to about 100 mg/kg/day.

For example, typically an effective dosage for atorvastatin calcium (known as atorvastatin hemicalcium or LIPITOR) or other salts of atorvastatin is about 1.0 mg to
5 about 80 mg per day (e.g., 10mg, 20mg, 40mg 80mg).

For example, typically an effective dosage for antihypertensives is in the range of about 0.01 to about 100 mg/kg/day.

For example, typically an effective dosage of amlodipine or a pharmaceutically acceptable salt thereof (e.g., amlodipine besylate, amlodipine
10 mesylate) is in the range of about 5 mg to about 10 mg per day.

An exemplary dosage for the triple combination of amlodipine and a pharmaceutically acceptable salt thereof (e.g., amlodipine besylate)/atorvastatin and a pharmaceutically acceptable salt thereof (e.g., atorvastatin hemicalcium)/ and
15 [2R,4S]-4-[(3,5-bis-trifluoromethyl-benzyl)-methoxycarbonyl-amino]-2-ethyl-6-trifluoromethyl-3,4-dihydro-2H-quinoline-1-carboxylic acid ethyl ester (torcetrapib) is in the range of 5-10mg per day/10-80mg per day/30-120mg per day.

For purposes of parenteral administration, solutions in sesame or peanut oil or in aqueous propylene glycol can be employed, as well as sterile aqueous solutions of the corresponding water-soluble salts. Such aqueous solutions may be suitably
20 buffered, if necessary, and the liquid diluent first rendered isotonic with sufficient saline or glucose. These aqueous solutions are especially suitable for intravenous, intramuscular, subcutaneous and intraperitoneal injection purposes. In this connection, the sterile aqueous media employed are all readily obtainable by standard techniques well-known to those skilled in the art.

25 Methods of preparing various pharmaceutical compositions with a certain amount of active ingredient are known, or will be apparent in light of this disclosure, to those skilled in this art. For examples, see Remington's Pharmaceutical Sciences, Mack Publishing Company, Easter, Pa., 15th Edition (1975).

Pharmaceutical compositions according to the invention may contain 0.1%-
30 95% of the compound(s) of this invention, preferably 1%-70%. In any event, the composition or formulation to be administered will contain a quantity of a compound(s) according to the invention in an amount effective to treat the condition or disease of the subject being treated.

Since the present invention relates to the treatment of diseases and conditions with a combination of active ingredients which may be administered separately, the invention also relates to combining separate pharmaceutical compositions in kit form. The kit includes two separate pharmaceutical compositions: amlodipine or a pharmaceutically acceptable acid addition salt thereof and a statin or a pharmaceutically acceptable salt thereof in association. The kit can include an exemplary container means for containing the separate compositions such as a divided bottle or a divided foil packet, however, the separate compositions may also be contained within a single, undivided container. Typically the kit includes directions for the administration of the separate components. The kit form is particularly advantageous when the separate components are preferably administered in different dosage forms (e.g., oral and parenteral), are administered at different dosage intervals, or when titration of the individual components of the combination is desired by the prescribing physician.

An example of such a kit is so-called blister pack. Blister packs are well known in the packaging industry and are being widely used for the packaging of pharmaceutical unit dosage forms (tablets, capsules, and the like). Blister packs generally consist of a sheet of relatively stiff material covered with a foil of a preferably transparent plastic material. During the packaging process recesses are formed in the plastic foil. The recesses have the size and shape of the tablets or capsules to be packed. Next, the tablets or capsules are placed in the recesses and the sheet of relatively stiff material is sealed against the plastic foil at the fact of the foil which is opposite from the direction in which the recesses were formed. As a result, the tablets or capsules are sealed in the recesses between the plastic foil and the sheet. Preferably the strength of the sheet is such that the tablets or capsules can be removed from the blister pack by manually applying pressure on the recesses whereby an opening is formed in the sheet at the place of the recess. The tablet or capsule can then be removed via said opening.

It may be desirable to provide a memory aid on the kit, e.g., in the form of numbers next to the tablets or capsules whereby the numbers correspond with the days of the regimen which the tablets or capsules so specified should be ingested. Another example of such a memory aid is a calendar printed on the card, e.g., Another example of such a memory aid is a calendar printed on the card, e.g., as follows "First Week, Monday, Tuesday, ...etc.... Second Week, Monday, Tuesday,..."

etc. Other variations of memory aids will be readily apparent. A "daily dose" can be a single tablet or capsule or several pills or capsules to be taken on a given day. Also, a daily dose of Formula I compound can consist of one tablet or capsule while a daily dose of the second compound can consist of several tablets or capsules, and
5 vice versa. The memory aid should reflect this.

In another specific embodiment of the invention, a dispenser designed to dispense the daily doses one at a time in the order of their intended use is provided. Preferably, the dispenser is equipped with a memory-aid, so as to further facilitate compliance with the regimen. An example of such a memory-aid is a mechanical
10 counter which indicates the number of daily doses that has been dispensed. Another example of such a memory-aid is a battery-powered micro-chip memory coupled with a liquid crystal readout, or audible reminder signal which, for example, reads out the date that the last daily dose has been taken and/or reminds one when the next dose is to be taken.

15 It should be understood that the invention is not limited to the particular embodiments described herein, but that various changes and modifications may be made without departing from the spirit and scope of this novel concept as defined by the following claims.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: —
because they relate to subject matter not required to be searched by this Authority, namely:
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☒ Claims Nos.: —
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.: —
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.1

Although claims 1-10 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

Continuation of Box I.1

Rule 39.1(iv) PCT - Method for treatment of the human or animal body by therapy

Continuation of Box I.2

Present claims 1-15 relate to an extremely large number of possible combination products and methods using combination products as well as medical indications. In fact, the claims contain so many possible permutations that a lack of clarity (and/or conciseness) within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search has been carried out for those parts of the application which do appear to be clear (and/or concise), namely the general idea underlying the invention as well as the only explicitly suggested combination. It is especially pointed out that the application does not contain any specific real example.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
